Tool Calling

Tool calling is a method that allows an LLM to use external tools or system to perform tasks it cannot do by itself.

~~python~~

```
{
  'name': 'check_inventory',
  'description': 'Get stock and price for a produ
  'parameters': {...}
}
```

json

```
{
  "name": "check_inventory",
  "arguments": {
    "product_name": "iPhone"
  }
}
```

LLM characteristic

- Generation
- Understand languages

LLM Disadvantage

- Fetch data from DB (No)
- Give me current temperature e.g. (No)
- News of today (No).

Limitation

1. Knowledge cutoff date
2. LLM → outside.

Solution Tool Calling

Tool Calling → Task performance.

LLM → Capabilities → Tools
↳ python functions
+
Code → to achieve.

Helps of Tool calling

LLM capability increases by passing tools to LLM are nothing but a python function. How to do a particular task

1. Tools create → functions
2. Tools schema → Json object
   - ↳ what tools
   - ↳ Details of description of each and every tools.
   - ↳ Parameters.
3. LLM call → Prompt + Tool Schema.
4. Run → O/P
3. LLM → [Prompt + LLM → Tools + Tools + Result]
